Weather Decision Gym

Field-level weather and yield forecasts for US crop insurers, retrained on every season’s real harvest.

Target market

US crop insurers and reinsurers in the Corn Belt (Iowa, Illinois, Minnesota), for corn and soybean policies.

The same verifier is sold to **US RL eval and data companies** as auto-graded weather tasks.

Problem

73%

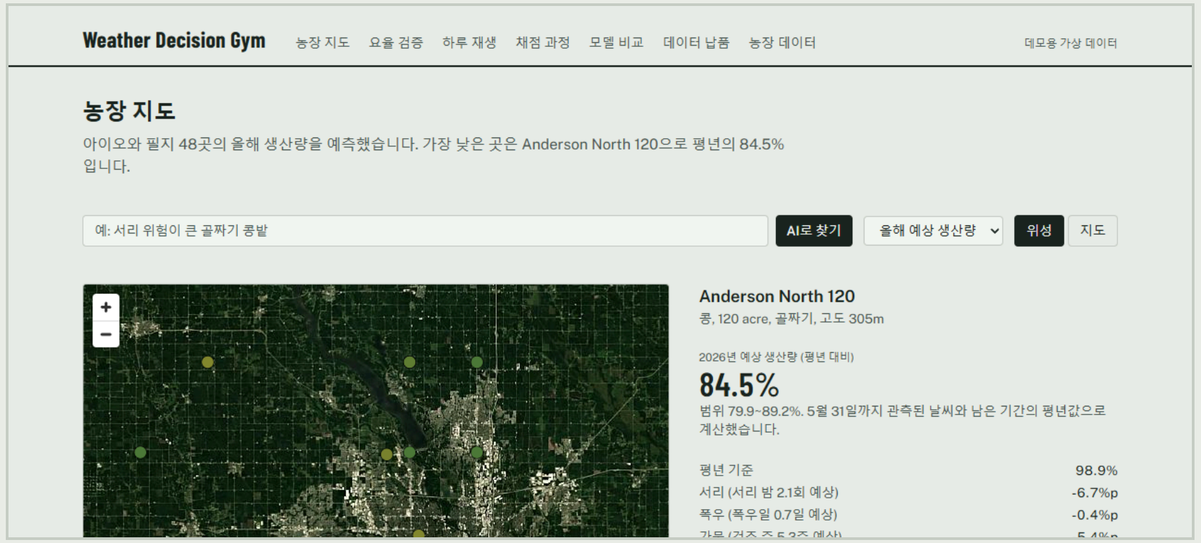

of US crop insurance payouts are weather-driven ($118.7B, 2001–2022). Yet pricing and claim checks run on county-level weather. No one has field-level weather-to-yield data checked against real harvests.

Built today · weather-decision-gym.vercel.app

Farm map: pick a field, get its 2026 yield as % of normal.

Insurer console: risk score vs. real losses → rate ranges.

How it works

Field weather → yield % per farm → retrained on each real harvest: error falls **6.2 → 2.5 %p**. **Claude** finds farms, writes briefings, and is the agent graded in our RL tasks.

Why us · next 7 days

One engine, two buyers: insurer rate ranges and auto-graded RL tasks. Next 7 days: live Open-Meteo, IEM and NOAA feeds, one insurer pilot.

Demo uses mock Iowa farms.
